

## Voya

Redesigning a multi-step  
combinational travel system into  
a guided mobile-first experience.

UX/UI Design

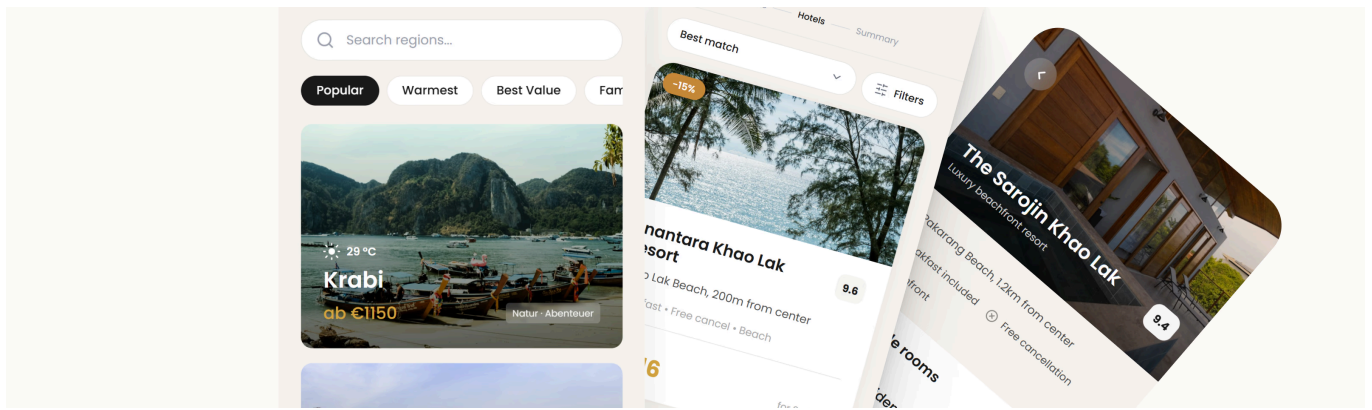

2023

Mobile App

Voya is a German travel platform specializing in combinational trips, for example, city + beach packages bundled into one structured booking. The system allows flexible configurations across destinations, durations, airports, and hotel dependencies.

The product logic is powerful.

The experience, however, was cognitively heavy.

Redesigning a multi-step combinational travel system into a guided mobile-first experience.

## 01. The Challenge

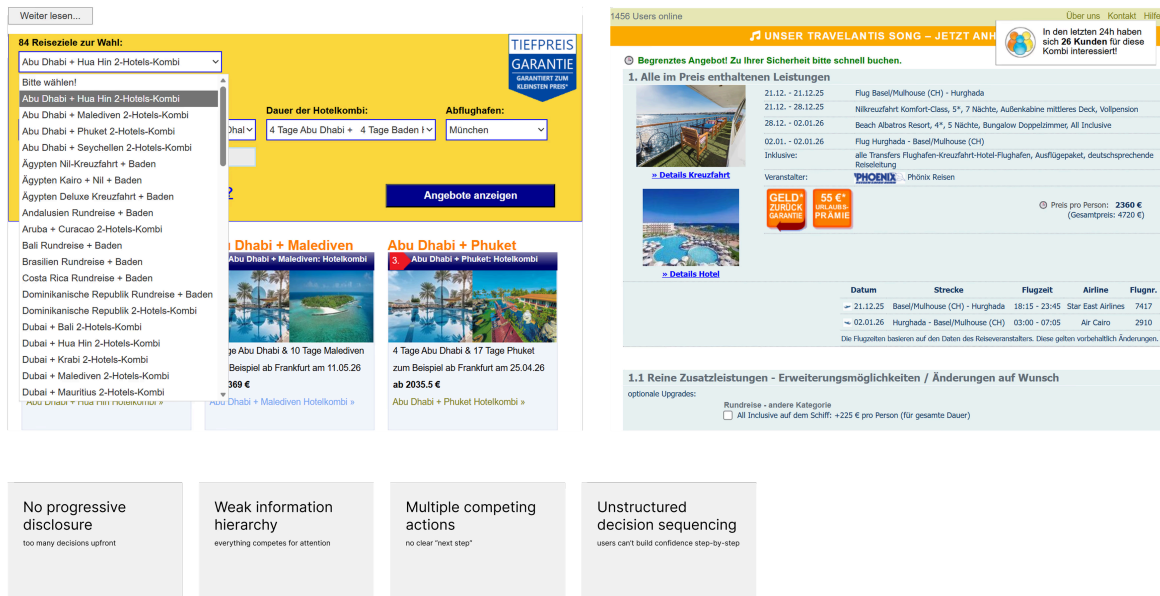

### Complexity to Clarity

How might we make a structurally complex travel booking system feel simple, guided, and calm, without removing its flexibility?

The existing experience exposed the entire system at once.

Users were confronted with:

- Dense dropdown logic
- Multiple simultaneous decisions
- Competing price signals
- Desktop-first layout patterns
- Visually heavy information blocks

|                                                         |                                                                 |                                                    |                                                                               |
|---------------------------------------------------------|-----------------------------------------------------------------|----------------------------------------------------|-------------------------------------------------------------------------------|
| No progressive disclosure<br>too many decisions upfront | Weak information hierarchy<br>everything competes for attention | Multiple competing actions<br>no clear "next step" | Unstructured decision sequencing<br>users can't build confidence step-by-step |
|---------------------------------------------------------|-----------------------------------------------------------------|----------------------------------------------------|-------------------------------------------------------------------------------|

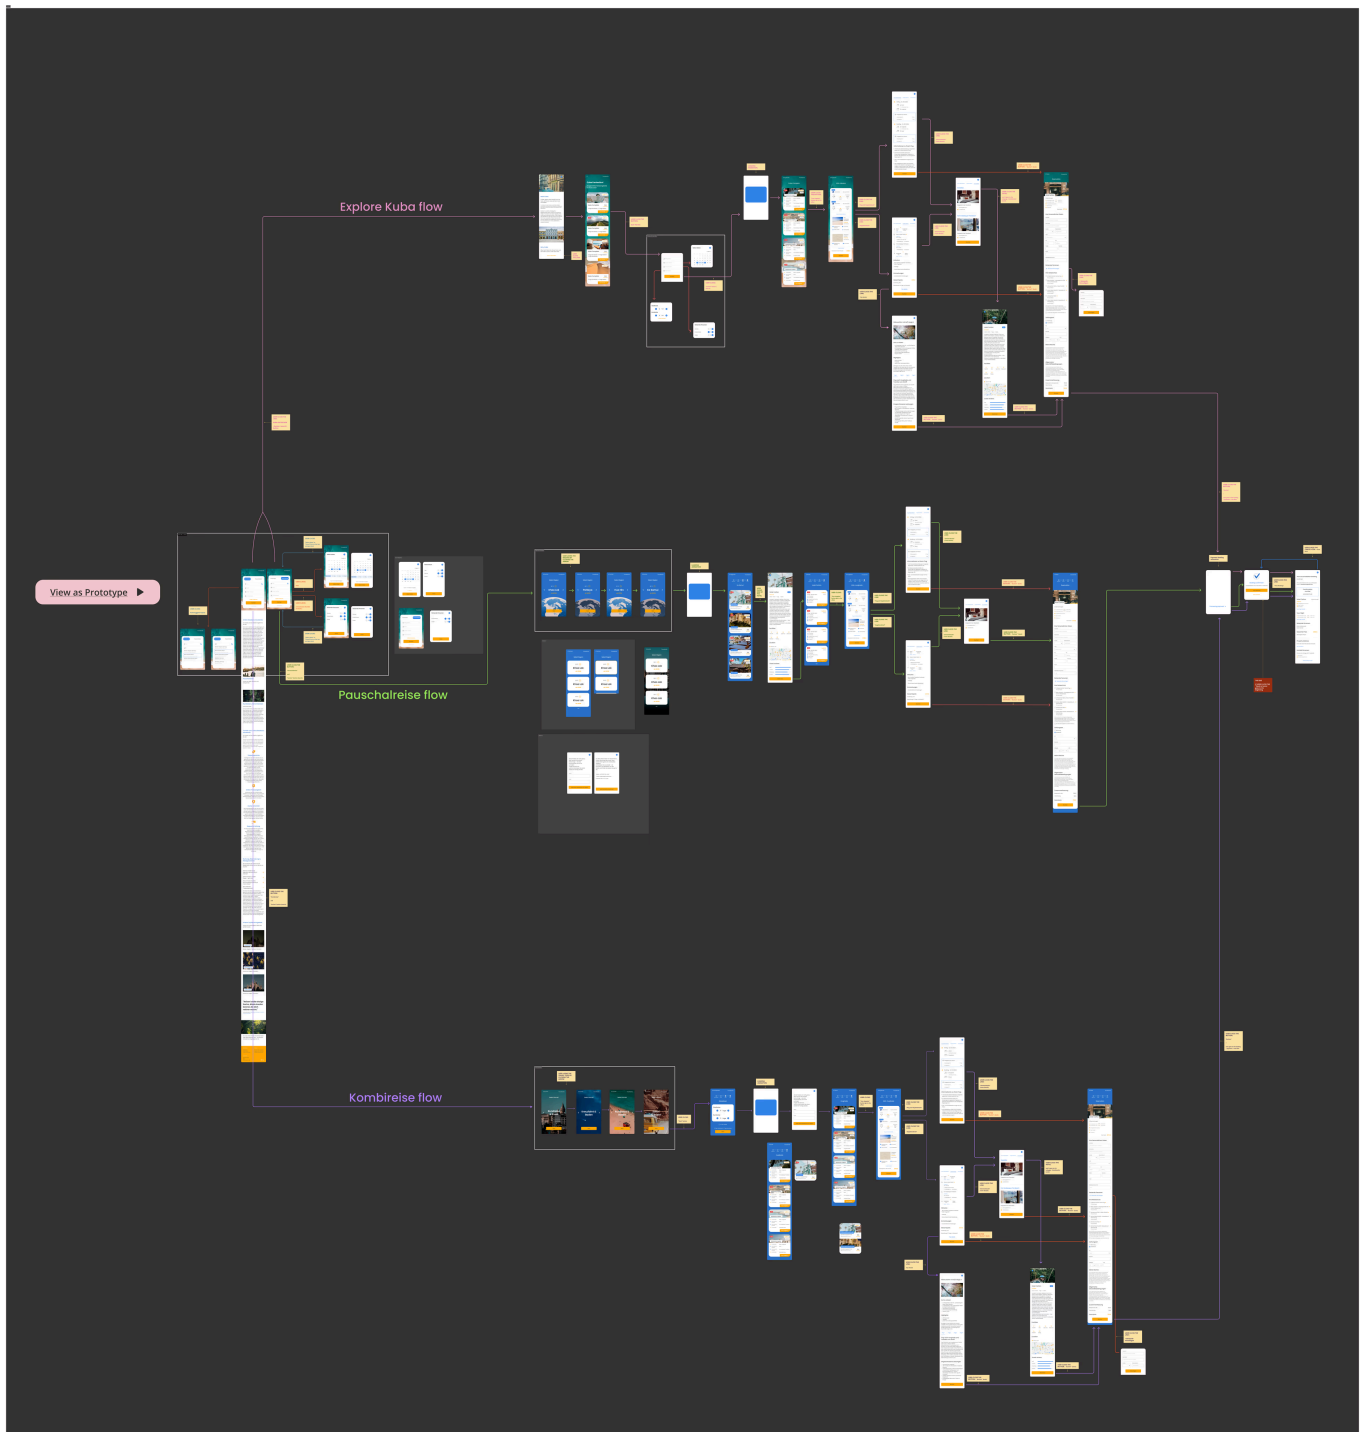

Legacy interface exposing full booking configuration upfront.

## 02. Process

# System Mapping

I mapped the full booking logic, including destination combinations, hotel dependencies, room selections, and pricing breakdowns, to separate structural complexity from UI complexity.

The goal was to understand what is essential at each step.

Full journey exploration during system mapping phase

### 03. Pattern Research

## Learning from Leaders

I analyzed modern travel platforms (e.g., Booking.com, Airbnb) to understand:

- How they stage decisions
- How they reduce cognitive load
- How they communicate pricing clarity
- How they maintain emotional calm in transactional flows

| Platform      | Decision Staging                                                | Reducing Cognitive Load                                                  | Pricing Clarity                                         |
|---------------|-----------------------------------------------------------------|--------------------------------------------------------------------------|---------------------------------------------------------|
| Booking.com   | Breaks booking into clear steps: list → detail → room → summary | Heavy use of filters + badges (free cancel, breakfast) to speed scanning | Strong price visibility in lists + clear "from" pricing |
| Airbnb        | Starts with a single strong listing, then expands into sections | Uses progressive disclosure: hides details until needed                  | Shows full price breakdown early, including fees        |
| Google Travel | Optimizes for comparison and quick exploration                  | Minimal UI + strong sorting, reduces visual noise                        | Pricing is visible but less explicit about fees         |

Key takeaway:

A card-based, mobile-first flow with staged decisions and consistent price visibility reduces overwhelm and increases confidence during booking.

04. Structural Rebuild

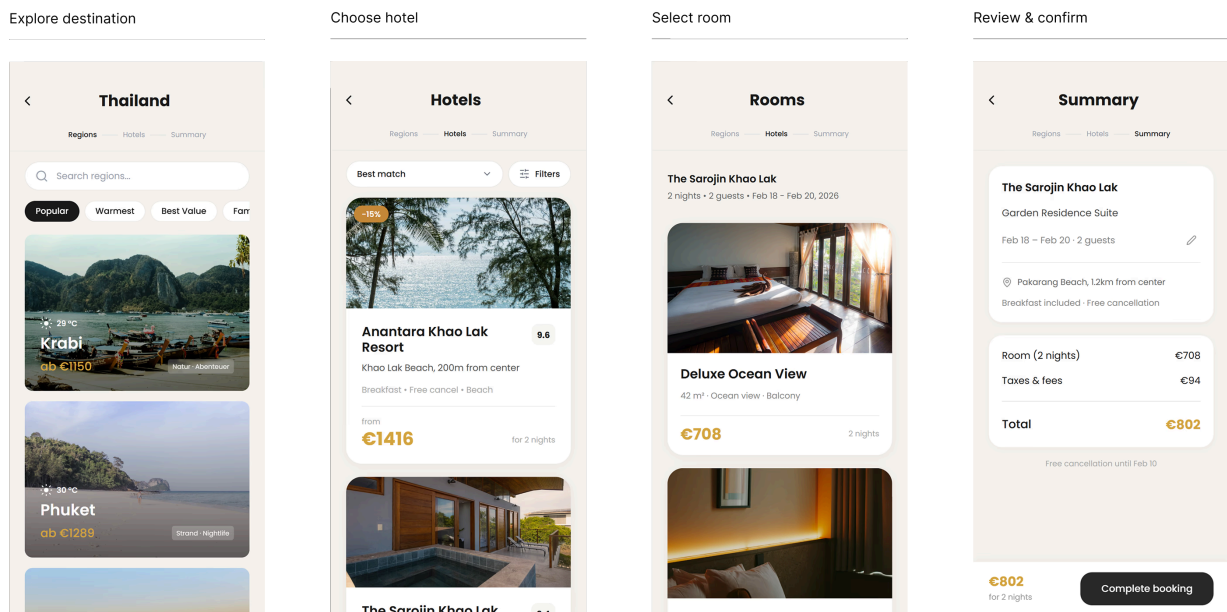

Zooming into One Journey

Destination → Hotel Selection → Room Selection → Summary

Instead of showcasing every legacy flow, this section demonstrates how structural clarity transforms the experience.

# Improvements Introduced

- Clear step progression with a visible progress indicator
- Calm visual system with reduced color noise
- Strong typographic hierarchy
- Pricing transparency at each stage
- One primary action per screen
- Reduced decision density per step

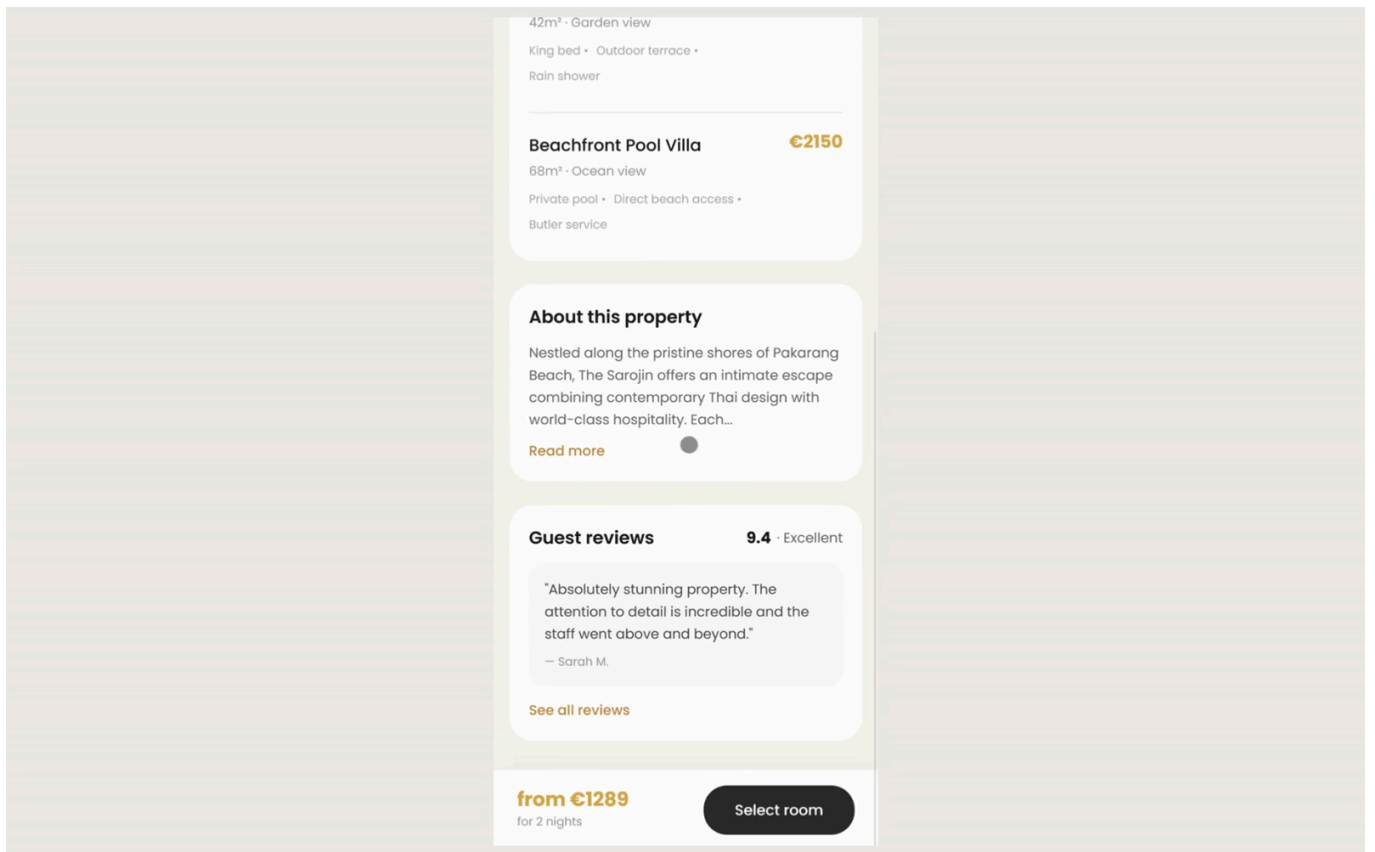

Guided mobile-first booking journey with progressive disclosure and clear step progression.

## Final Flow

### *End-to-End Experience*

The redesigned journey demonstrates how complex systems can feel intuitive when structure, pacing, and hierarchy are aligned.

End-to-end booking experience demonstrating structured complexity and calm interaction pacing.
